✓ allowed **own** only on their own reports or pairings — refused (401 not signed in / 403 wrong role)

† **The API accepts it from this role, but the interface gives that role no screen for it.** Staff work in the Staff workspace and administrators in Administration; only Pet Coordinators verify pairings in the interface. An administrator's Home, Explore and Report a pet send them back to Administration; a report's own page still opens.

The role is re-read from the database on every request, so a role change or suspension takes effect at once. Nobody edits another person's report: the server lets staff change a report's *status*, never its details, and a Pet Coordinator's confirmation is what marks both reports Returned.

MATCHING AND VERIFICATION
